

What is Claimed is:

- 1 1. A method for synchronizing and identifying a cell code for an orthogonal frequency
2 division multiplexing (OFDM) based cellular communication system, comprising the
3 steps of:
4 (a) building a time-domain frame structure for a cell search procedure, each frame in
5 said frame structure consisting of a plurality of OFDM symbols, said frame
6 structure exhibiting periodic signal pattern and containing the information about
7 said cell code; and
8 (b) performing said cell search procedure including the steps of timing
9 synchronization and cell code identification.
- 1 2. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein in step (b), said timing
3 synchronization is to detect OFDM symbol timing and frame timing, and said cell
4 code identification is to detect said cell code.
- 1 3. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein said cell search
3 procedure in step (b) further includes a verification step to avoid false detection.
- 1 4. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein in a frame, there is at
3 least one OFDM symbol that exhibits said periodic signal pattern and there is at least
4 one OFDM symbol that contains the information about said cell code.
- 1 5. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein there are at least two

- 3 OFDM symbols in a frame that have the same data in some portions leading to said
4 periodic signal pattern in a frame.
- 1 6. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein there is at least one
3 unit formed by two or more successive OFDM symbols having said periodic signal
4 pattern in a frame.
- 1 7. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein at least one OFDM
3 symbol in a frame that contains the information about said cell code.
- 1 8. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 1, wherein each OFDM symbol of
3 length N_{OFDM} samples consists of N_{FFT} -sample useful data and N_{GI} -sample cyclic
4 prefix (CP), the i th OFDM symbol, indicated by $CPICH_i$, is comprised of CP and N_i
5 repetitive duplicates of a v_i -point short sequence, where $N_{FFT} = v_i \cdot N_i$ and $N_i \geq 1$, the
6 other OFDM symbols in said frame includes traffic channel (TCH) signal or another
7 common pilot channel (CPICH) signal, CPICH signal and TCH signal are allocated in
8 different OFDM symbols.
- 1 9. The method for synchronizing and identifying a cell code for an OFDM based
2 cellular communication system as claimed in claim 8, wherein said cell search
3 procedure in step (b) uses the correlation property of CP and said periodic signal
4 pattern of said frame structure to detect said timing.
- 1 10. The method for synchronizing and identifying a cell code for an OFDM based

2 cellular communication system as claimed in claim 8, wherein said cell search
3 procedure in step (b) uses the correlation property of CPICH signal to detect said cell
4 code.

1 11. A time-domain frame structure used in cell detection for an orthogonal frequency
2 division multiplexing (OFDM) based cellular communication system, said frame
3 structure exhibiting periodic signal pattern to detect frame timing and containing the
4 information about the cell code of desired cell in common pilot channel (CPICH)
5 signal to identify said cell code.

1 12. The time-domain frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein each frame in said frame
3 structure consists of a plurality of OFDM symbols and each OFDM symbol of length
4 N_{OFDM} samples consists of N_{FFT} -sample useful data and N_{GP} -sample cyclic prefix (CP),
5 the i th OFDM symbol, indicated by $CPICH_i$, is comprised of CP and N_i repetitive
6 duplicates of a v_i -point short sequence, where $N_{FFT} = v_i \cdot N_i$ and $N_i \geq 1$, the other
7 OFDM symbols in said frame includes traffic channel (TCH) signal or another
8 common pilot channel (CPICH) signal, CPICH signal and TCH signal are allocated in
9 different OFDM symbols.

1 13. The time-domain frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein said time-domain frame
3 structure is introduced in a cell search procedure including the steps of timing
4 synchronization and cell code identification.

1 14. The time-domain frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 13, wherein said step of timing

3 synchronization is to detect OFDM symbol timing and frame timing, and said cell
4 code identification is to detect said cell code.

1 15. The time-domain frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein in a frame, there is at least
3 one OFDM symbol that exhibits said periodic signal pattern and there is at least one
4 OFDM symbol that contains the information about said cell code.

1 16. The frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein in a frame, there is at least
3 one OFDM symbol that exhibits said periodic signal pattern and there is at least one
4 OFDM symbol that contains the information about said cell code.

1 17. The frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein there are at least two OFDM
3 symbols in a frame that have the same data in some portions leading to said periodic
4 signal pattern in a frame.

1 18. The frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein there is at least one unit
3 formed by two or more successive OFDM symbols having said periodic signal pattern
4 in a frame.

1 19. The frame structure used in cell detection for an OFDM based cellular
2 communication system as claimed in claim 11, wherein at least one OFDM symbol in
3 a frame that contains the information about said cell code.
